

## **BGP Tutorial**

Philip Smith <pfs@cisco.com>
APNIC 22
4th-8th September 2006
Kaohsiung, Taiwan

#### **Tutorial Outline**

- Part 1 Introduction to BGP
   Coffee Break
- Part 2 Deploying BGPLunch
- Part 3 Multihoming
   Coffee Break
- Part 4 Troubleshooting

#### **Presentation Slides**

Are available on

ftp://ftp-eng.cisco.com

/pfs/seminars/APNIC22-BGP-part1+2.pdf

And on the APNIC 22 website

Feel free to ask questions any time

# **BGP Techniques for Internet Service Providers**

- BGP Basics
- Scaling BGP
- Using Communities
- Deploying BGP in an ISP network

# **BGP Basics**

What is this BGP thing?

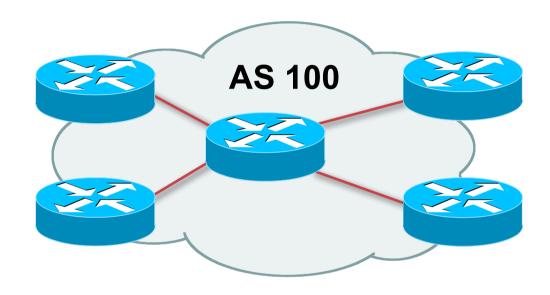

## **Border Gateway Protocol**

Routing Protocol used to exchange routing information between networks

exterior gateway protocol

- Described in RFC4271
  - RFC4276 gives an implementation report on BGP-4 RFC4277 describes operational experiences using BGP-4
- The Autonomous System is BGP's fundamental operating unit It is used to uniquely identify networks with common routing policy

# Autonomous System (AS)

- Collection of networks with same routing policy
- Single routing protocol
- Usually under single ownership, trust and administrative control
- Identified by a unique number

# Autonomous System Number (ASN)

An ASN is a 16 bit number

1-64511 are assigned by the RIRs

64512-65534 are for private use and should never appear on the Internet

0 and 65535 are reserved

32 bit ASNs are coming soon

www.ietf.org/internet-drafts/draft-ietf-idr-as4bytes-12.txt

With AS 23456 reserved for the transition

# Autonomous System Number (ASN)

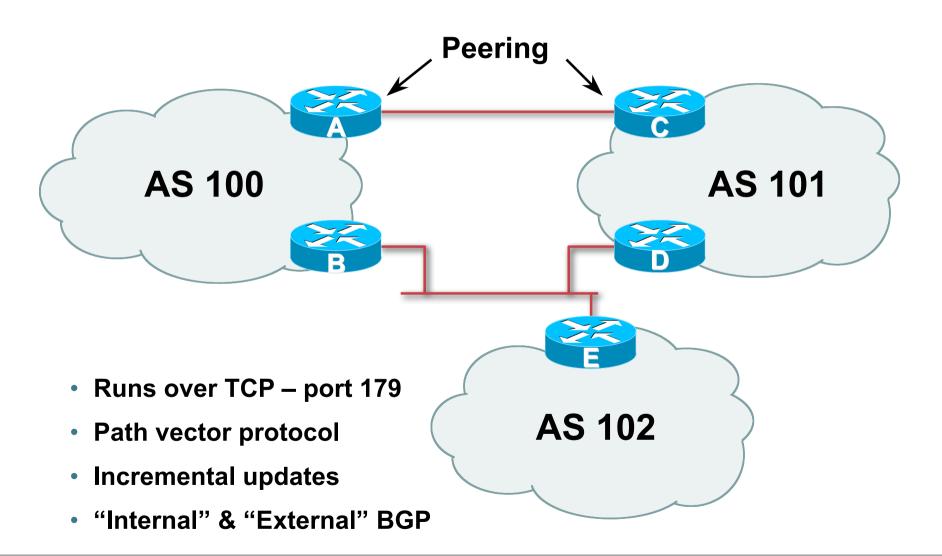

- ASNs are distributed by the Regional Internet Registries
- Also available from upstream ISPs who are members of one of the RIRs

Current ASN allocations up to 41983 have been made to the RIRs

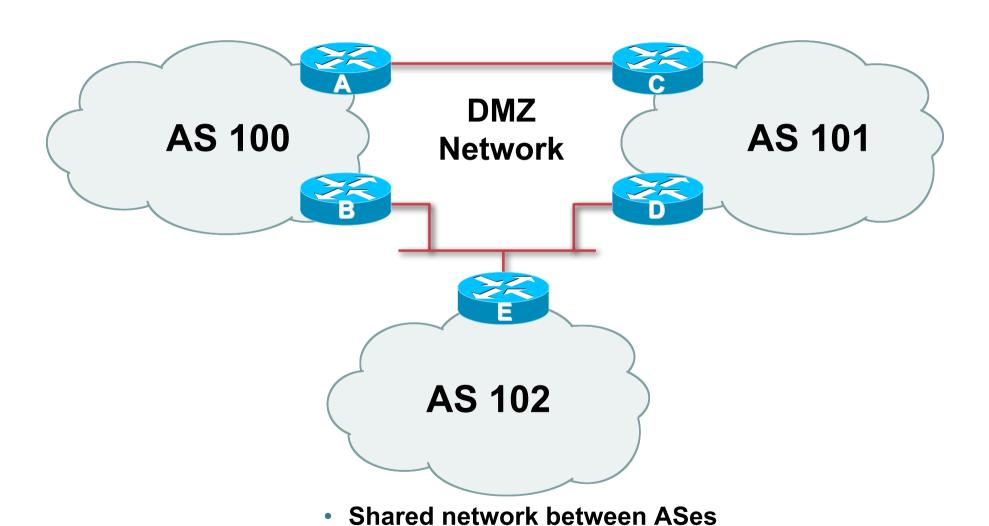

Of these, around 23000 are visible on the Internet

See www.iana.org/assignments/as-numbers

### **BGP Basics**

# **Demarcation Zone (DMZ)**

# **BGP General Operation**

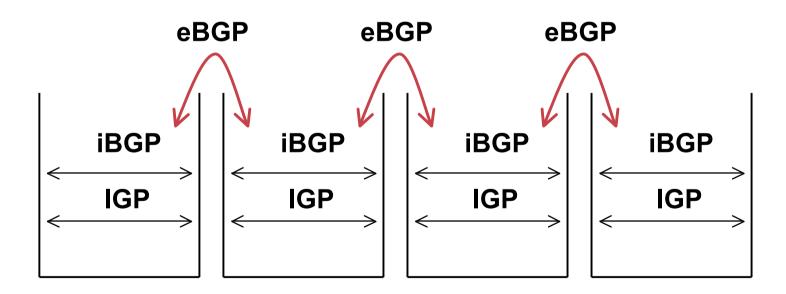

- Learns multiple paths via internal and external BGP speakers
- Picks the best path and installs in the forwarding table
- Best path is sent to external BGP neighbours
- Policies applied by influencing the best path selection

#### eBGP & iBGP

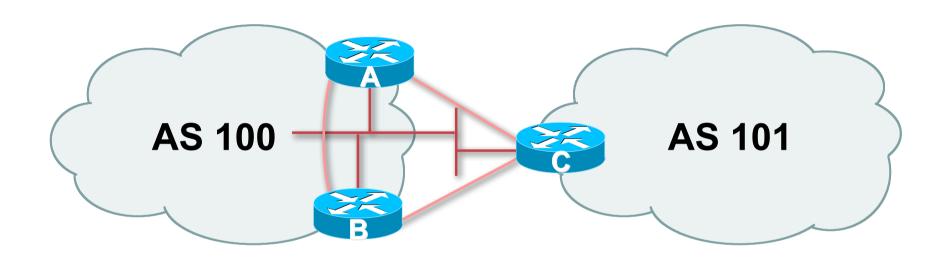

- BGP used internally (iBGP) and externally (eBGP)
- iBGP used to carry some/all Internet prefixes across ISP backbone ISP's customer prefixes
- eBGP used to
   exchange prefixes with other ASes
   implement routing policy

#### BGP/IGP model used in ISP networks

Model representation

## **External BGP Peering (eBGP)**

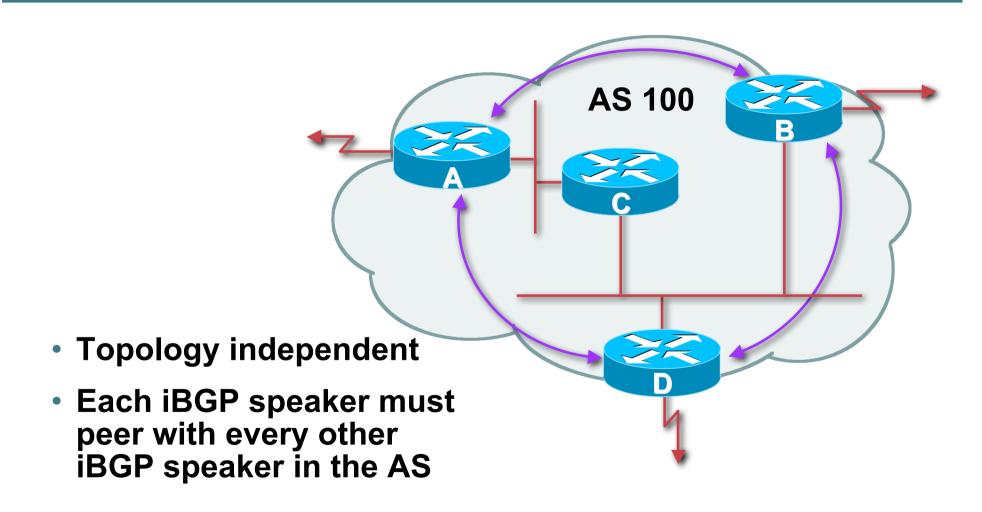

- Between BGP speakers in different AS
- Should be directly connected
- Never run an IGP between eBGP peers

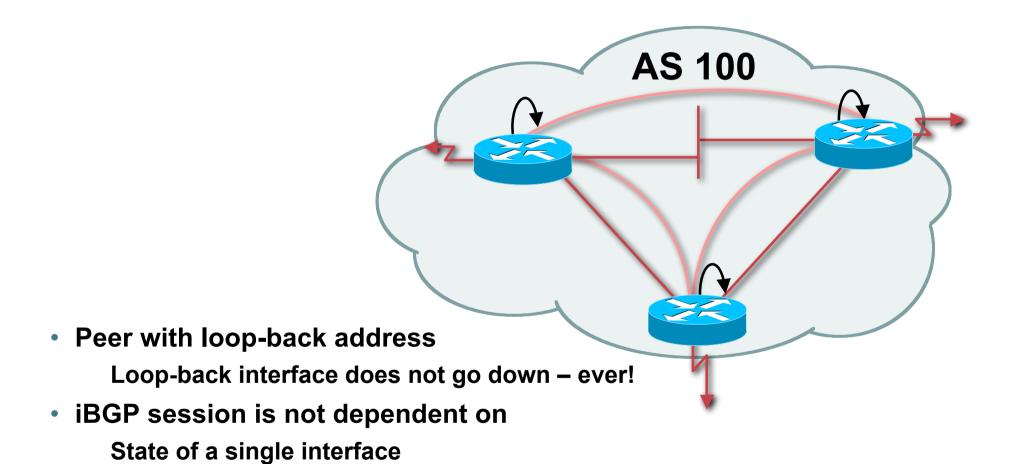

# Internal BGP (iBGP)

- BGP peer within the same AS
- Not required to be directly connected
   IGP takes care of inter-BGP speaker connectivity
- iBGP speakers need to be fully meshed they originate connected networks they do not pass on prefixes learned from other iBGP speakers

# **Internal BGP Peering (iBGP)**

# Peering to loopback addresses

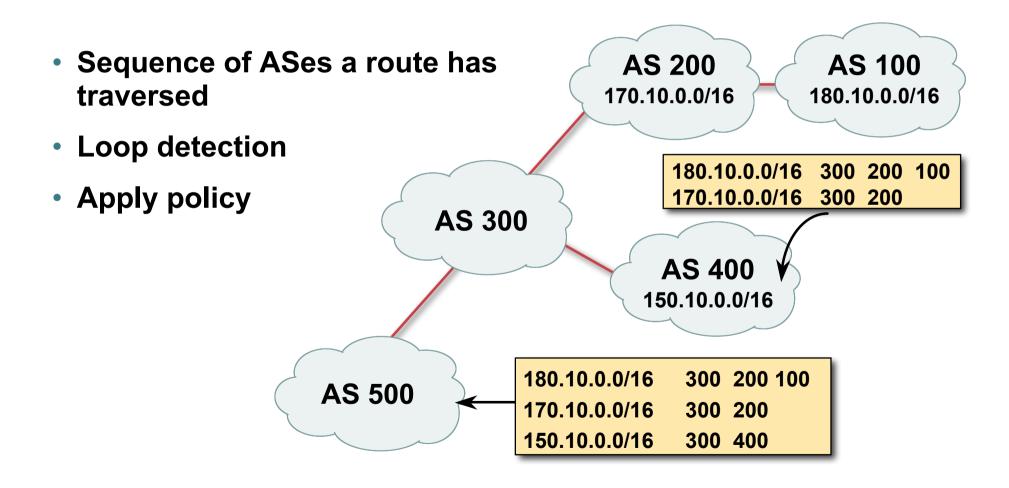

**Physical topology** 

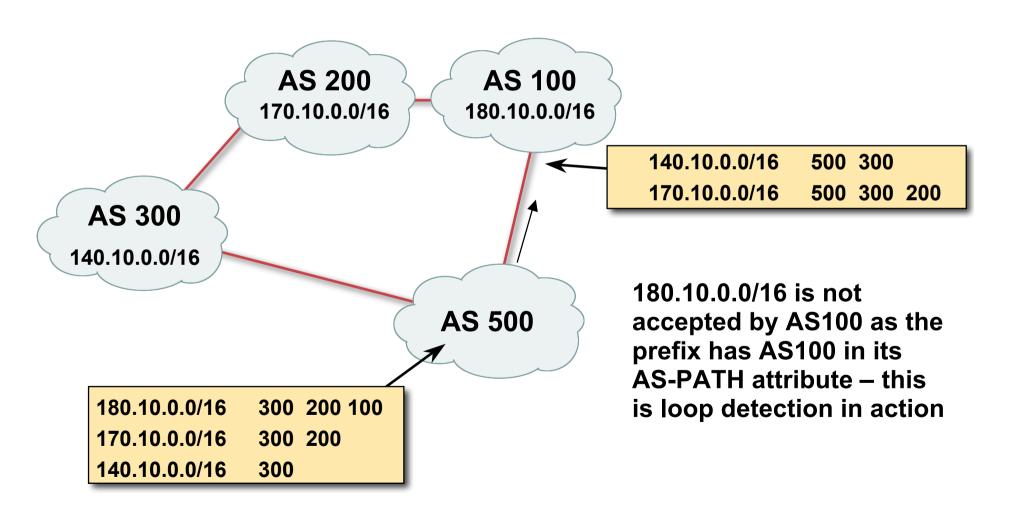

## **BGP Attributes**

**Information about BGP** 

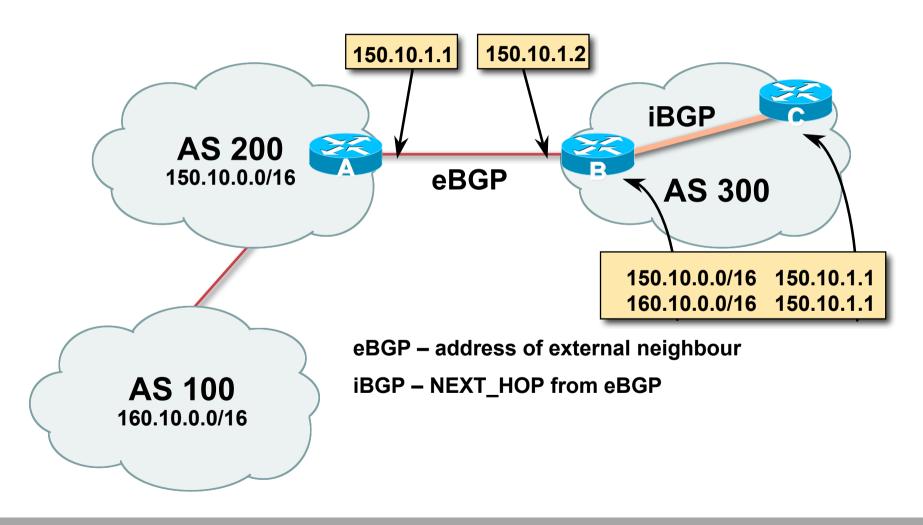

#### AS-Path

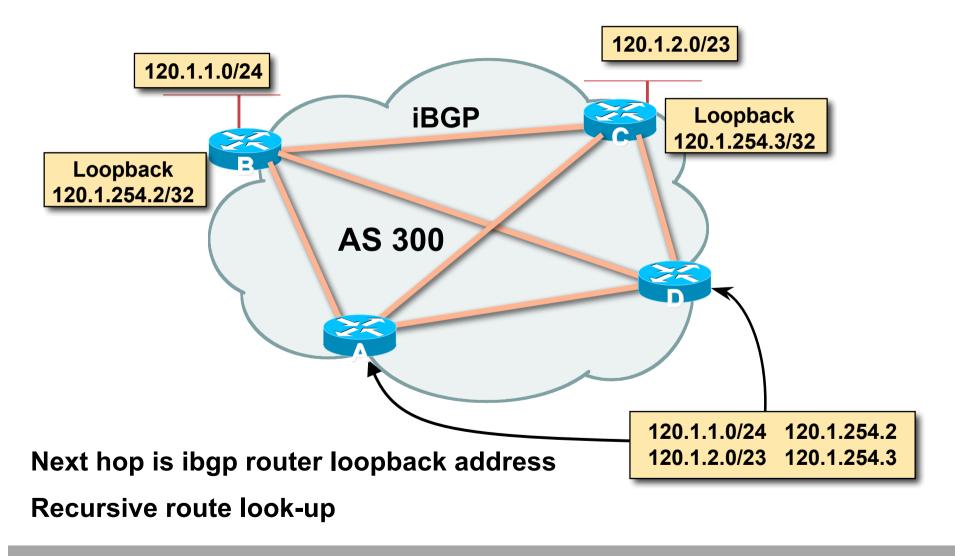

## **AS-Path loop detection**

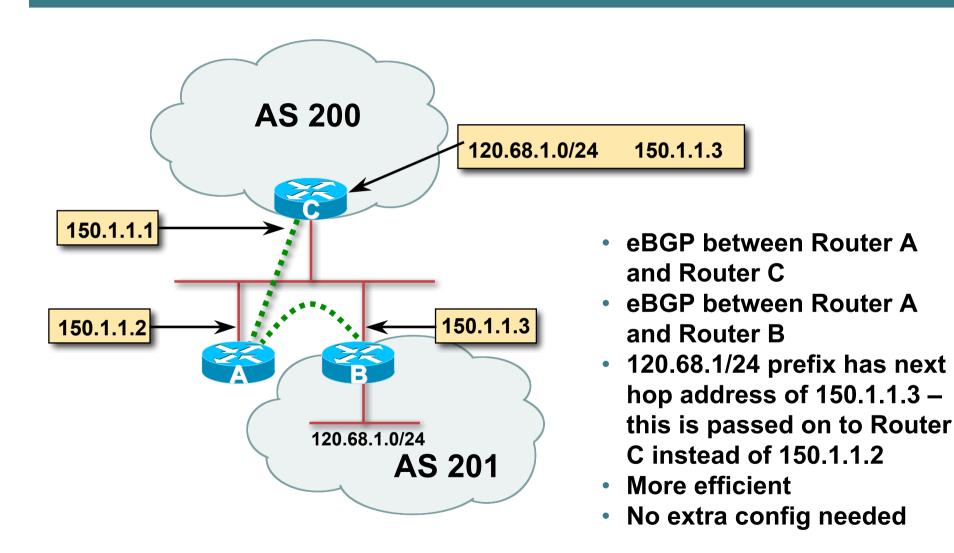

## **Next Hop**

## **iBGP Next Hop**

## Third Party Next Hop

# Next Hop (Summary)

- IGP should carry route to next hops
- Recursive route look-up
- Unlinks BGP from actual physical topology
- Allows IGP to make intelligent forwarding decision

## Origin

- Conveys the origin of the prefix
- Historical attribute

**Used in transition from EGP to BGP** 

- Influences best path selection
- Three values: IGP, EGP, incomplete

IGP – generated by BGP network statement

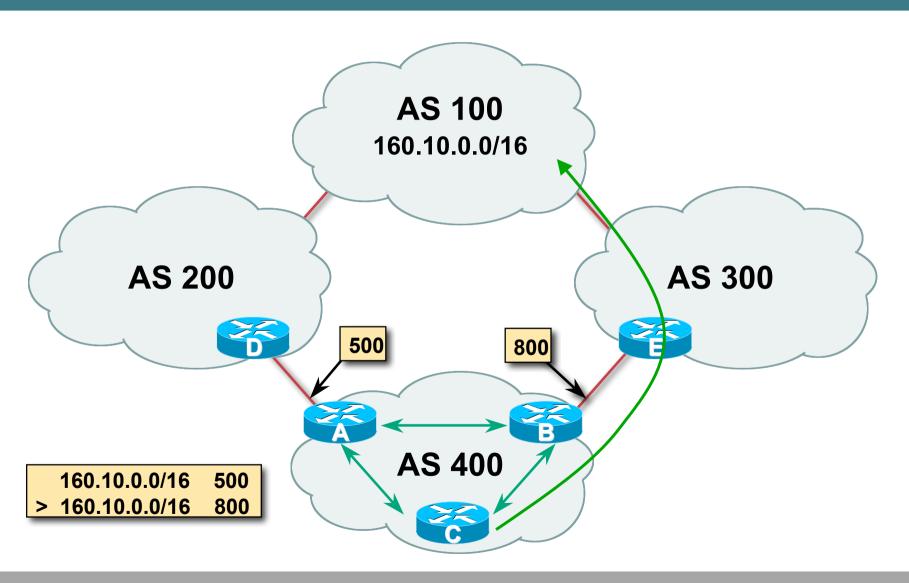

EGP – generated by EGP

incomplete – redistributed from another routing protocol

## Aggregator

- Conveys the IP address of the router or BGP speaker generating the aggregate route
- Useful for debugging purposes
- Does not influence best path selection

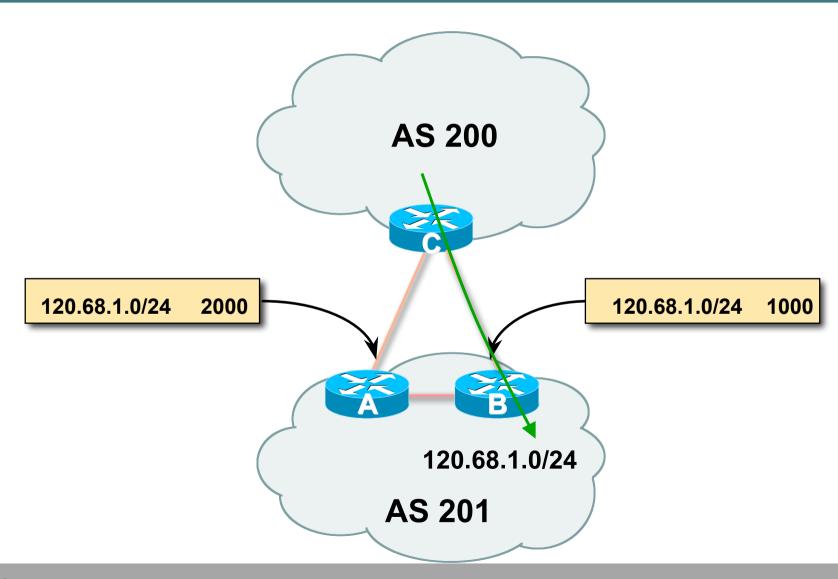

## **Local Preference**

#### **Local Preference**

- Local to an AS non-transitive
   Default local preference is 100 (IOS)
- Used to influence BGP path selection determines best path for outbound traffic
- Path with highest local preference wins

# **Multi-Exit Discriminator (MED)**

#### **Multi-Exit Discriminator**

- Inter-AS non-transitive & optional attribute
- Used to convey the relative preference of entry points determines best path for *inbound* traffic
- Comparable if paths are from same AS
   bgp always-compared-med allows comparisons of MEDs
   from different ASes
- Path with lowest MED wins
- Absence of MED attribute implies MED value of zero (RFC4271)

#### Multi-Exit Discriminator "metric confusion"

MED is non-transitive and optional attribute

Some implementations send learned MEDs to iBGP peers by default, others do not

Some implementations send MEDs to eBGP peers by default, others do not

Default metric value varies according to vendor implementation

Original BGP spec made no recommendation

Some implementations said no metric was equivalent to  $2^{32}$ -1 (the highest possible) or  $2^{32}$ -2

Other implementations said no metric was equivalent to 0

Potential for "metric confusion"

## Community

Communities are described in RFC1997

**Transitive and Optional Attribute** 

32 bit integer

Represented as two 16 bit integers (RFC1998)

Common format is < local-ASN>:xx

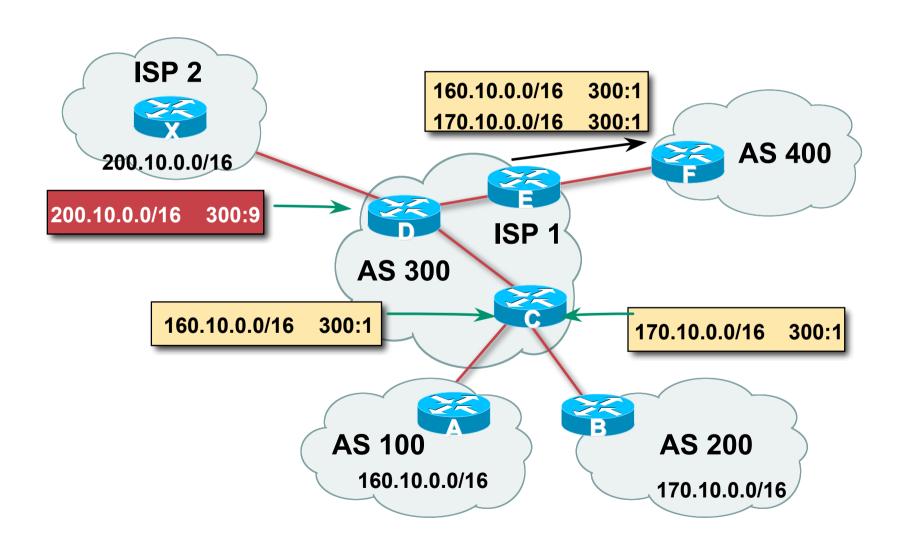

0:0 to 0:65535 and 65535:0 to 65535:65535 are reserved

Used to group destinations

Each destination could be member of multiple communities

Very useful in applying policies within and between ASes

# Community

#### **Well-Known Communities**

Several well known communities

www.iana.org/assignments/bgp-well-known-communities

no-export

65535:65281

do not advertise to any eBGP peers

no-advertise

65535:65282

do not advertise to any BGP peer

no-export-subconfed

65535:65283

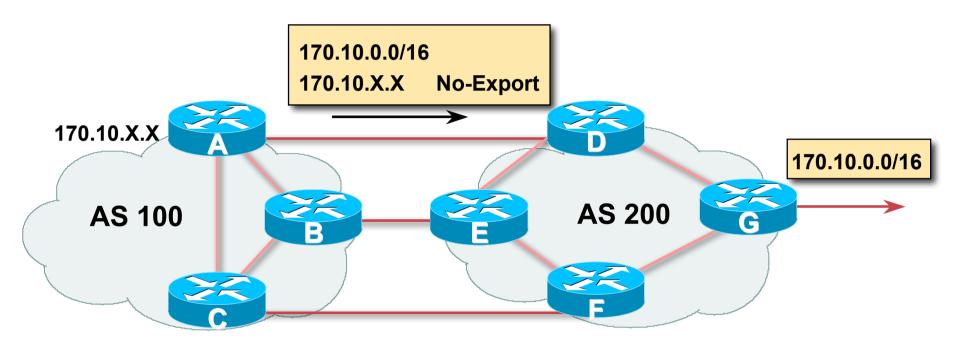

do not advertise outside local AS (only used with confederations)

no-peer

65535:65284

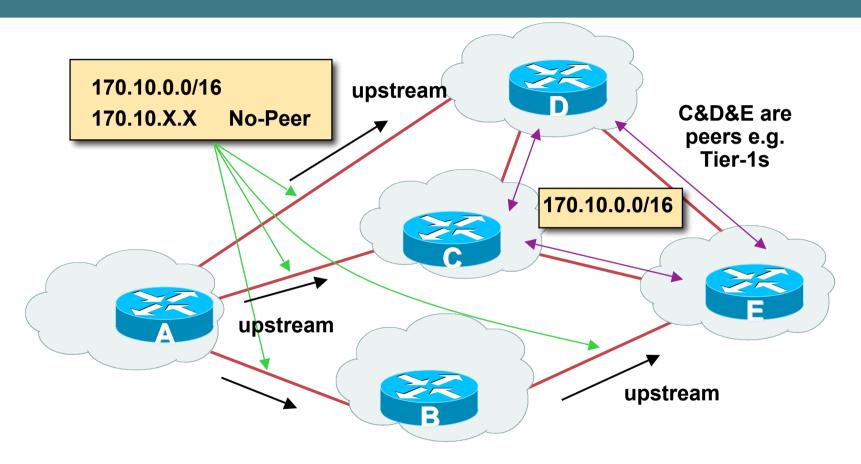

do not advertise to bi-lateral peers (RFC3765)

# **No-Export Community**

- AS100 announces aggregate and subprefixes
   aim is to improve loadsharing by leaking subprefixes
- Subprefixes marked with no-export community
- Router G in AS200 does not announce prefixes with no-export community set

### **No-Peer Community**

 Sub-prefixes marked with no-peer community are not sent to bilateral peers

They are only sent to upstream providers

# Community Implementation details

Community is an optional attribute

Some implementations send communities to iBGP peers by default, some do not

Some implementations send communities to eBGP peers by default, some do not

Being careless can lead to community "confusion"

ISPs need consistent community policy within their own networks

And they need to inform peers, upstreams and customers about their community expectations

## **BGP Path Selection Algorithm**

Why Is This the Best Path?

# **BGP Path Selection Algorithm for IOS Part One**

- Do not consider path if no route to next hop
- Do not consider iBGP path if not synchronised (Cisco IOS)
- Highest weight (local to router)
- Highest local preference (global within AS)
- Prefer locally originated route
- Shortest AS path

## **BGP Path Selection Algorithm for IOS Part Two**

- Lowest origin code
   IGP < EGP < incomplete</li>
- Lowest Multi-Exit Discriminator (MED)

If bgp deterministic-med, order the paths before comparing If bgp always-compare-med, then compare for all paths otherwise MED only considered if paths are from the same AS (default)

# **BGP Path Selection Algorithm for IOS Part Three**

- Prefer eBGP path over iBGP path
- Path with lowest IGP metric to next-hop
- Lowest router-id (originator-id for reflected routes)
- Shortest Cluster-List

Client must be aware of Route Reflector attributes!

Lowest neighbour IP address

#### **BGP Path Selection Algorithm**

#### In multi-vendor environments:

Make sure the path selection processes are understood for each brand of equipment

Each vendor has slightly different implementations, extra steps, extra features, etc

Watch out for possible MED confusion

## **Applying Policy with BGP**

**Control!** 

# **Applying Policy in BGP:** Why?

Policies are applied to:

Influence BGP Path Selection by setting BGP attributes

Determine which prefixes are announced or blocked

Determine which AS-paths are preferred, permitted, or denied

Determine route groupings and their effects

Decisions are generally based on prefix, AS-path and community

## **Applying Policy with BGP: Tools**

 Most implementations have tools to apply policies to BGP:

**Prefix manipulation/filtering** 

**AS-PATH** manipulation/filtering

**Community Attribute setting and matching** 

 Implementations also have policy language which can do various match/set constructs on the attributes of chosen BGP routes

**Extending BGP** 

- Documented in RFC2842
- Capabilities parameters passed in BGP open message
- Unknown or unsupported capabilities will result in NOTIFICATION message
- Codes:

0 to 63 are assigned by IANA by IETF consensus64 to 127 are assigned by IANA "first come first served"128 to 255 are vendor specific

#### **Current capabilities are:**

0	Reserved	[RFC3392]
1	Multiprotocol Extensions for BGP-4	[RFC2858]
2	Route Refresh Capability for BGP-4	[RFC2918]
3	Cooperative Route Filtering Capability	[ID]
4	Multiple routes to a destination capability	[RFC3107]
64	Graceful Restart Capability	[ID]
65	Support for 4 octet ASNs	[ID]
66	Deprecated 2003-03-06	
67	Support for Dynamic Capability	[ID]

See www.iana.org/assignments/capability-codes

Multiprotocol extensions

This is a whole different world, allowing BGP to support more than IPv4 unicast routes

Examples include: v4 multicast, IPv6, v6 multicast, VPNs

**Another tutorial (or many!)** 

- Route refresh is a well known scaling technique covered shortly
- The other capabilities are still in development or not widely implemented or deployed yet

#### **BGP for Internet Service Providers**

- BGP Basics
- Scaling BGP
- Using Communities
- Deploying BGP in an ISP network

## **BGP Scaling Techniques**

### **BGP Scaling Techniques**

- How does a service provider:
  - Scale the iBGP mesh beyond a few peers?
  - Implement new policy without causing flaps and route churning?
  - Keep the network stable, scalable, as well as simple?

## **BGP Scaling Techniques**

- Route Refresh
- Route Reflectors
- Confederations

## **Dynamic Reconfiguration**

**Route Refresh** 

#### **Route Refresh**

BGP peer reset required after every policy change

Because the router does not store prefixes which are rejected by policy

Hard BGP peer reset:

Terminates BGP peering & Consumes CPU
Severely disrupts connectivity for all networks

Soft BGP peer reset (or Route Refresh):

**BGP** peering remains active

Impacts only those prefixes affected by policy change

#### **Route Refresh Capability**

- Facilitates non-disruptive policy changes
- For most implementations, no configuration is needed

Automatically negotiated at peer establishment

- No additional memory is used
- Requires peering routers to support "route refresh capability" – RFC2918

#### **Dynamic Reconfiguration**

- Use Route Refresh capability if supported find out from the BGP neighbour status display Non-disruptive, "Good For the Internet"
- If not supported, see if implementation has a workaround
- Only hard-reset a BGP peering as a last resort

Consider the impact to be equivalent to a router reboot

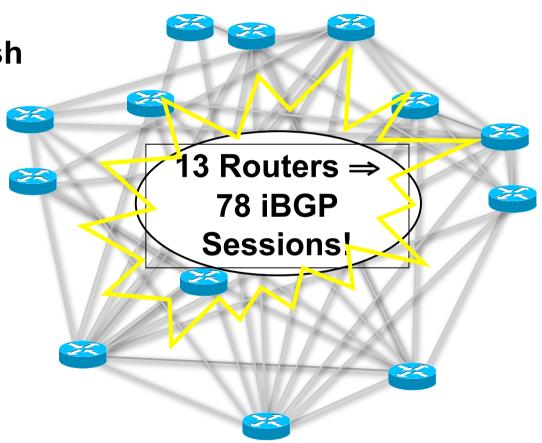

#### **Route Reflectors**

Scaling the iBGP mesh

#### Scaling iBGP mesh

Avoid ½n(n-1) iBGP mesh

n=1000 ⇒ nearly half a million ibgp sessions!

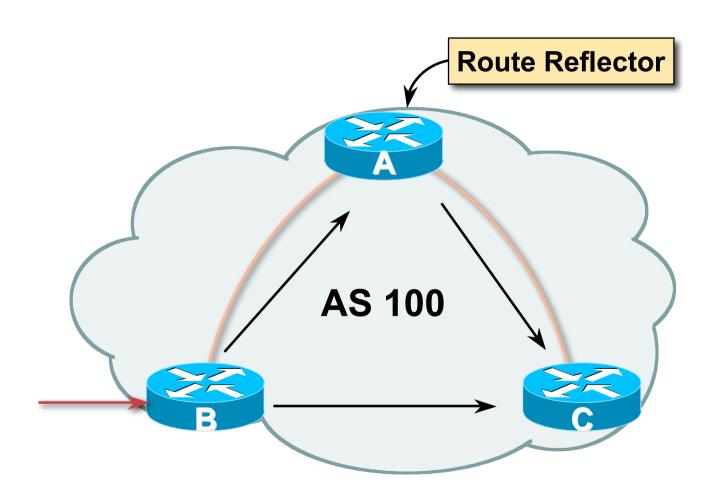

**Two solutions** 

Route reflector – simpler to deploy and run

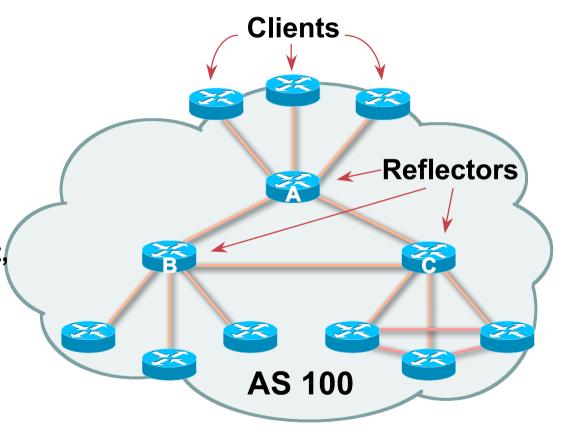

**Confederation – more complex, has corner case advantages** 

## **Route Reflector: Principle**

#### **Route Reflector**

- Reflector receives path from clients and non-clients
- Selects best path
- If best path is from client, reflect to other clients and non-clients
- If best path is from non-client, reflect to clients only
- Non-meshed clients
- Described in RFC4456

### Route Reflector Topology

- Divide the backbone into multiple clusters
- At least one route reflector and few clients per cluster
- Route reflectors are fully meshed
- Clients in a cluster could be fully meshed
- Single IGP to carry next hop and local routes

## Route Reflectors: Loop Avoidance

Originator\_ID attribute

Carries the RID of the originator of the route in the local AS (created by the RR)

Cluster\_list attribute

The local cluster-id is added when the update is sent by the RR

Best to set cluster-id is from router-id (address of loopback)

(Some ISPs use their own cluster-id assignment strategy – but needs to be well documented!)

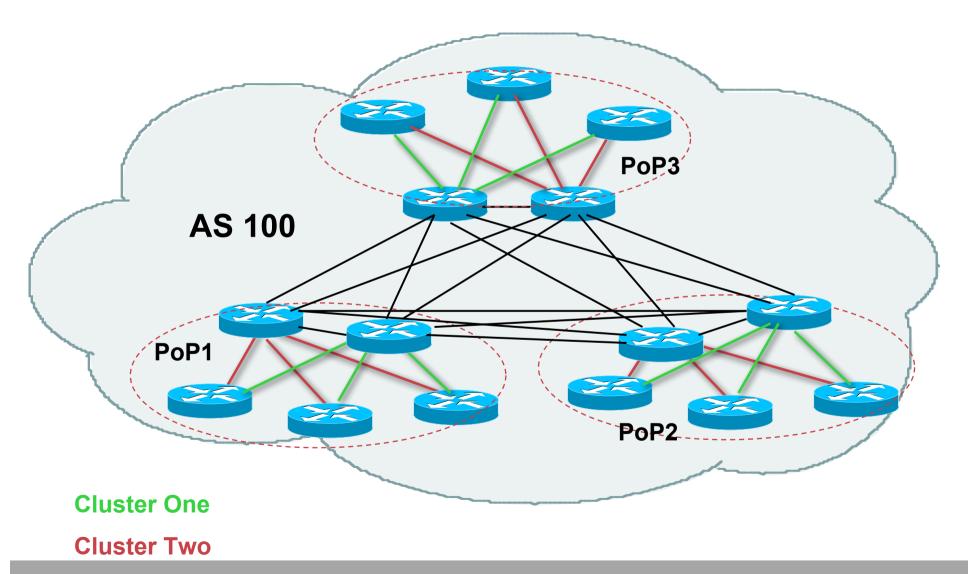

# Route Reflectors: Redundancy

- Multiple RRs can be configured in the same cluster
  - not advised!

All RRs in the cluster must have the same cluster-id (otherwise it is a different cluster)

- A router may be a client of RRs in different clusters
  - Common today in ISP networks to overlay two clusters redundancy achieved that way
  - → Each client has two RRs = redundancy

# Route Reflectors: Redundancy

#### **Route Reflector: Benefits**

- Solves iBGP mesh problem
- Packet forwarding is not affected
- Normal BGP speakers co-exist
- Multiple reflectors for redundancy
- Easy migration
- Multiple levels of route reflectors

# Route Reflectors: Migration

Where to place the route reflectors?

Always follow the physical topology!

This will guarantee that the packet forwarding won't be affected

Typical ISP network:

PoP has two core routers

Core routers are RR for the PoP

Two overlaid clusters

# Route Reflectors: Migration

Typical ISP network:

Core routers have fully meshed iBGP
Create further hierarchy if core mesh too big
Split backbone into regions

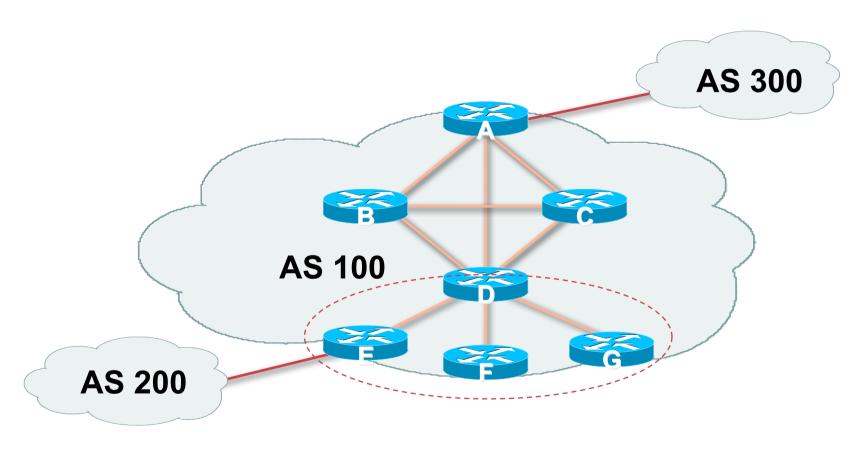

Configure one cluster pair at a time

Eliminate redundant iBGP sessions

Place maximum one RR per cluster

Easy migration, multiple levels

#### **Route Reflector: Migration**

 Migrate small parts of the network, one part at a time

## **BGP** Confederations

#### Confederations

Divide the AS into sub-AS

eBGP between sub-AS, but some iBGP information is kept

Preserve NEXT\_HOP across the sub-AS (IGP carries this information)

**Preserve LOCAL\_PREF and MED** 

- Usually a single IGP
- Described in RFC3065

## Confederations (Cont.)

Visible to outside world as single AS –
 "Confederation Identifier"

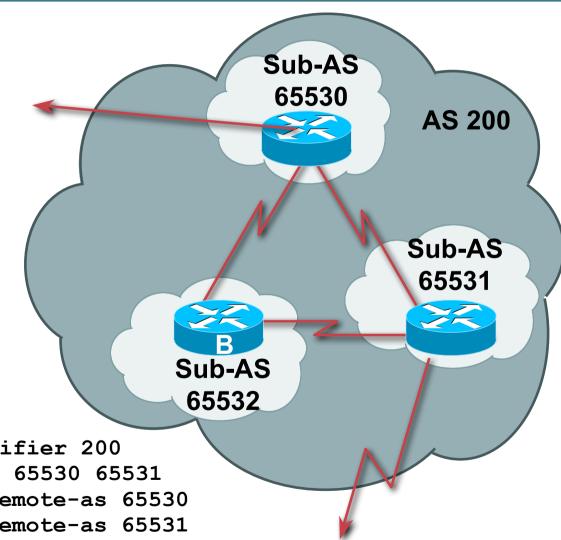

Each sub-AS uses a number from the private AS range (64512-65534)

iBGP speakers in each sub-AS are fully meshed

The total number of neighbours is reduced by limiting the full mesh requirement to only the peers in the sub-AS

Can also use Route-Reflector within sub-AS

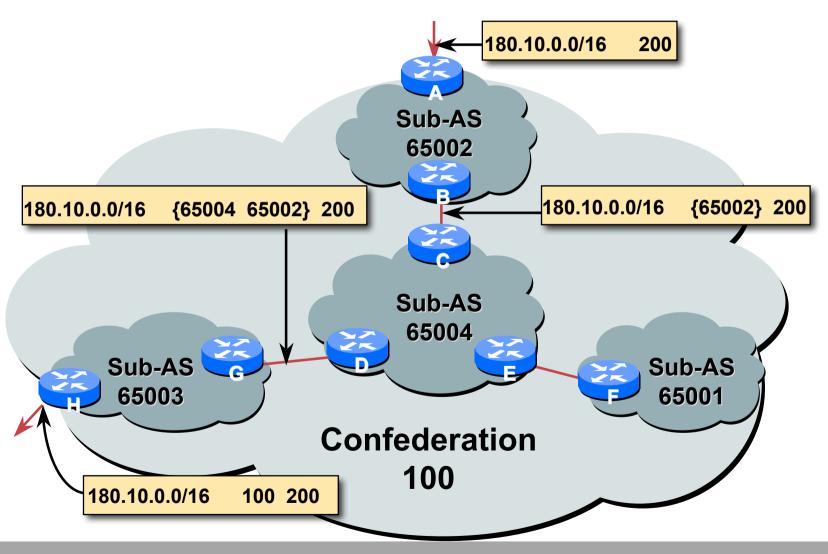

#### Confederations

Configuration (rtr B):

bgp confederation identifier 200 bgp confederation peers 65530 65531 neighbor 141.153.12.1 remote-as 65530 neighbor 141.153.17.2 remote-as 65531

## **Confederations: AS-Sequence**

### **Route Propagation Decisions**

Same as with "normal" BGP:

From peer in same sub-AS → only to external peers

From external peers → to all neighbors

"External peers" refers to

Peers outside the confederation

Peers in a different sub-AS

Preserve LOCAL\_PREF, MED and NEXT\_HOP

### **RRs or Confederations**

	Internet Connectivity	Multi-Level Hierarchy	Policy Control	Scalability	Migration Complexity
Confederations	Anywhere in the Network	Yes	Yes	Medium	Medium to High
Route Reflectors	Anywhere in the Network	Yes	Yes	Very High	Very Low

Most new service provider networks now deploy Route Reflectors from Day One

### More points about confederations

 Can ease "absorbing" other ISPs into you ISP – e.g., if one ISP buys another

Or can use AS masquerading feature available in some implementations to do a similar thing

 Can use route-reflectors with confederation sub-AS to reduce the sub-AS iBGP mesh

# **BGP Scaling Techniques**

Route Refresh

**Use should be mandatory** 

Route Reflectors/Confederations
 The only way to scale iBGP mesh

# **Route Flap Damping**

**Network Stability for the 1990s** 

**Network Instability for the 21st Century!** 

## Route Flap Damping

- For many years, Route Flap Damping was a strongly recommended practice
- Now it is strongly discouraged as it causes far greater network instability than it cures
- But first, the theory...

### **Route Flap Damping**

Route flap

Going up and down of path or change in attribute

BGP WITHDRAW followed by UPDATE = 1 flap

eBGP neighbour going down/up is NOT a flap

Ripples through the entire Internet

Wastes CPU

Damping aims to reduce scope of route flap propagation

## Route Flap Damping (continued)

Requirements

Fast convergence for normal route changes

**History predicts future behaviour** 

**Suppress oscillating routes** 

Advertise stable routes

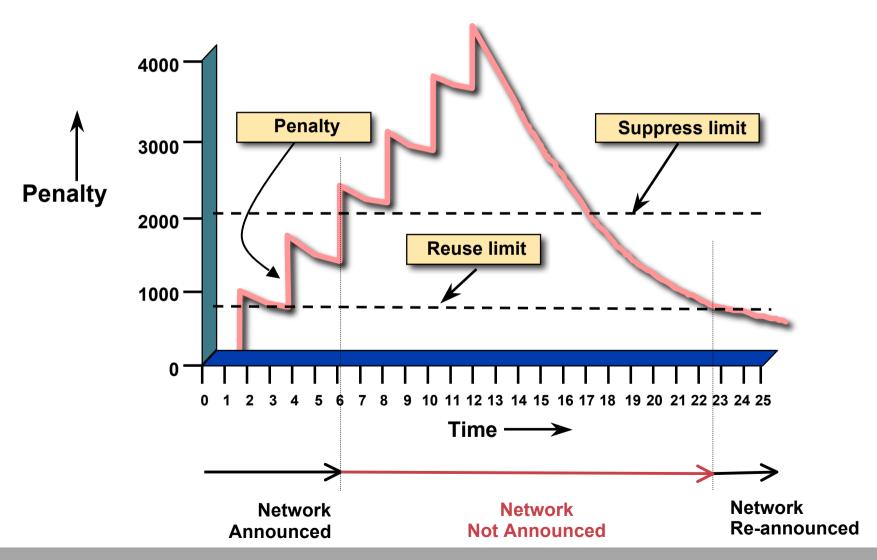

Implementation described in RFC 2439

### **Operation**

Add penalty (1000) for each flap
 Change in attribute gets penalty of 500

- Exponentially decay penalty half life determines decay rate
- Penalty above suppress-limit
   do not advertise route to BGP peers
- Penalty decayed below reuse-limit
   re-advertise route to BGP peers
   penalty reset to zero when it is half of reuse-limit

# **Operation**

### **Operation**

- Only applied to inbound announcements from eBGP peers
- Alternate paths still usable
- Controllable by at least:

Half-life

reuse-limit

suppress-limit

maximum suppress time

## Configuration

 Implementations allow various policy control with flap damping

Fixed damping, same rate applied to all prefixes

Variable damping, different rates applied to different ranges of prefixes and prefix lengths

## **Route Flap Damping History**

- First implementations on the Internet by 1995
- Vendor defaults too severe

RIPE Routing Working Group recommendations in ripe-178, ripe-210, and ripe-229

http://www.ripe.net/ripe/docs

But many ISPs simply switched on the vendors' default values without thinking

#### **Serious Problems:**

 "Route Flap Damping Exacerbates Internet Routing Convergence"

Zhuoqing Morley Mao, Ramesh Govindan, George Varghese & Randy H. Katz, August 2002

- "What is the sound of one route flapping?"
   Tim Griffin, June 2002
- Various work on routing convergence by Craig Labovitz and Abha Ahuja a few years ago
- "Happy Packets"

Closely related work by Randy Bush et al

#### **Problem 1:**

#### One path flaps:

BGP speakers pick next best path, announce to all peers, flap counter incremented

Those peers see change in best path, flap counter incremented

After a few hops, peers see multiple changes simply caused by a single flap → prefix is suppressed

#### **Problem 2:**

- Different BGP implementations have different transit time for prefixes
  - Some hold onto prefix for some time before advertising Others advertise immediately
- Race to the finish line causes appearance of flapping, caused by a simple announcement or path change → prefix is suppressed

#### Solution:

- Do NOT use Route Flap Damping whatever you do!
- RFD will unnecessarily impair access

to your network and

to the Internet

 More information contained in RIPE Routing Working Group recommendations:

www.ripe.net/ripe/docs/ripe-378.[pdf,html,txt]

### **BGP for Internet Service Providers**

- BGP Basics
- Scaling BGP
- Using Communities
- Deploying BGP in an ISP network

### **Service Provider use of Communities**

Some examples of how ISPs make life easier for themselves

### **BGP Communities**

- Another ISP "scaling technique"
- Prefixes are grouped into different "classes" or communities within the ISP network
- Each community means a different thing, has a different result in the ISP network

#### **BGP Communities**

Communities are generally set at the edge of the ISP network

Customer edge: customer prefixes belong to different communities depending on the services they have purchased

Internet edge: transit provider prefixes belong to difference communities, depending on the loadsharing or traffic engineering requirements of the local ISP, or what the demands from its BGP customers might be

Two simple examples follow to explain the concept

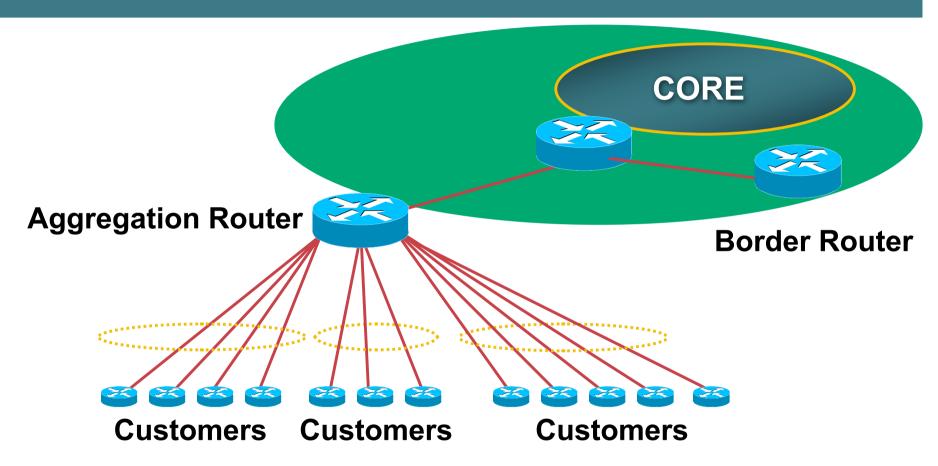

- This demonstrates how communities might be used at the customer edge of an ISP network
- ISP has three connections to the Internet:
  - IXP connection, for local peers
  - Private peering with a competing ISP in the region
  - Transit provider, who provides visibility to the entire Internet
- Customers have the option of purchasing combinations of the above connections

Community assignments:

IXP connection: community 100:2100

Private peer: community 100:2200

- Customer who buys local connectivity (via IXP) is put in community 100:2100
- Customer who buys peer connectivity is put in community 100:2200
- Customer who wants both IXP and peer connectivity is put in 100:2100 and 100:2200
- Customer who wants "the Internet" has no community set
   We are going to announce his prefix everywhere

Communities set at the aggregation router where the prefix is injected into the ISP's iBGP

- No need to alter filters at the network border when adding a new customer
- New customer simply is added to the appropriate community

Border filters already in place take care of announcements

⇒ Ease of operation!

## **Community Example – Internet Edge**

- This demonstrates how communities might be used at the peering edge of an ISP network
- ISP has four types of BGP peers:

Customer

**IXP** peer

Private peer

**Transit provider** 

- The prefixes received from each can be classified using communities
- Customers can opt to receive any or all of the above

## **Community Example – Internet Edge**

Community assignments:

Customer prefix: community 100:3000

IXP prefix: community 100:3100

Private peer prefix: community 100:3200

- BGP customer who buys local connectivity gets 100:3000
- BGP customer who buys local and IXP connectivity receives community 100:3000 and 100:3100
- BGP customer who buys full peer connectivity receives community 100:3000, 100:3100, and 100:3200
- Customer who wants "the Internet" gets everything

Gets default route originated by aggregation router

Or pays money to get all 190k prefixes

## **Community Example – Internet Edge**

No need to create customised filters when adding customers

**Border router already sets communities** 

Installation engineers pick the appropriate community set when establishing the customer BGP session

⇒ Ease of operation!

## **Community Example – Summary**

- Two examples of customer edge and internet edge can be combined to form a simple community solution for ISP prefix policy control
- More experienced operators tend to have more sophisticated options available

Advice is to start with the easy examples given, and then proceed onwards as experience is gained

### **BGP for Internet Service Providers**

- BGP Basics
- Scaling BGP
- Using Communities
- Deploying BGP in an ISP network

# Deploying BGP in an ISP Network

Okay, so we've learned all about BGP now; how do we use it on our network??

# **Deploying BGP**

- The role of IGPs and iBGP
- Aggregation
- Receiving Prefixes
- Configuration Tips

### The role of IGP and iBGP

Ships in the night?

Or

**Good foundations?** 

### **BGP versus OSPF/ISIS**

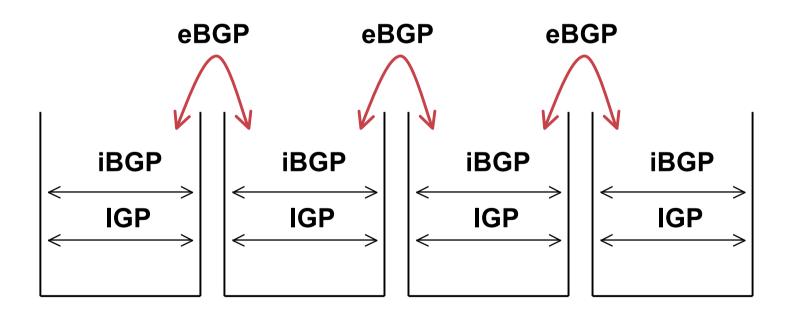

- Internal Routing Protocols (IGPs)
  - examples are ISIS and OSPF
  - used for carrying infrastructure addresses
  - **NOT** used for carrying Internet prefixes or customer prefixes
  - design goal is to minimise number of prefixes in IGP to aid scalability and rapid convergence

### **BGP versus OSPF/ISIS**

- BGP used internally (iBGP) and externally (eBGP)
- iBGP used to carry some/all Internet prefixes across backbone customer prefixes
- eBGP used to
   exchange prefixes with other ASes
   implement routing policy

### BGP/IGP model used in ISP networks

Model representation

### **BGP versus OSPF/ISIS**

#### DO NOT:

distribute BGP prefixes into an IGP distribute IGP routes into BGP use an IGP to carry customer prefixes

YOUR NETWORK WILL NOT SCALE

## Injecting prefixes into iBGP

- Use iBGP to carry customer prefixes don't ever use IGP
- Point static route to customer interface
- Enter network into BGP process

Ensure that implementation options are used so that the prefix always remains in iBGP, regardless of state of interface

i.e. avoid iBGP flaps caused by interface flaps

# Aggregation

**Quality or Quantity?** 

## **Aggregation**

- Aggregation means announcing the address block received from the RIR to the other ASes connected to your network
- Subprefixes of this aggregate may be:
  - **Used internally in the ISP network**
  - Announced to other ASes to aid with multihoming
- Unfortunately too many people are still thinking about class Cs, resulting in a proliferation of /24s in the Internet routing table

### **Aggregation**

- Address block should be announced to the Internet as an aggregate
- Subprefixes of address block should NOT be announced to Internet unless special circumstances (more later)
- Aggregate should be generated internally

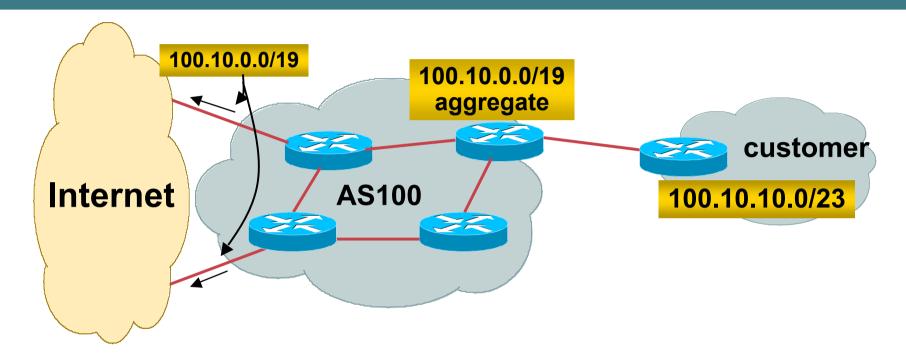

Not on the network borders!

## **Announcing an Aggregate**

- ISPs who don't and won't aggregate are held in poor regard by community
- Registries publish their minimum allocation size Anything from a /20 to a /22 depending on RIR
- No real reason to see anything longer than a /22 prefix in the Internet

BUT there are currently >106000 /24s!

## **Aggregation – Example**

- Customer has /23 network assigned from AS100's /19 address block
- AS100 announced /19 aggregate to the Internet

## Aggregation – Good Example

- Customer link goes down
   their /23 network becomes unreachable
   /23 is withdrawn from AS100's iBGP
- announced

  no BGP hold down problems

  no BGP propagation delays

  no damping by other ISPs

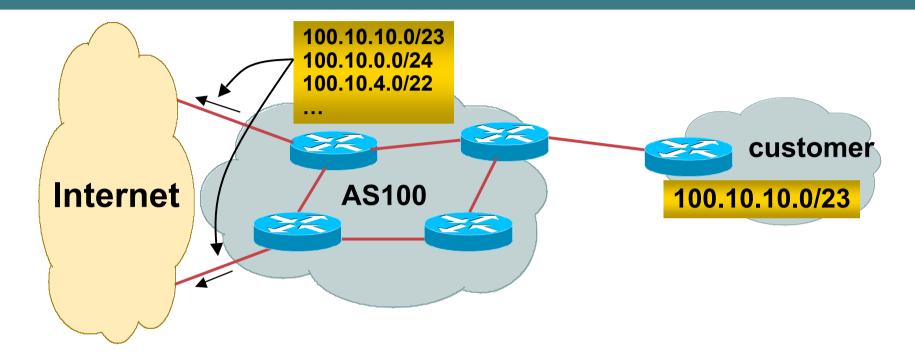

/19 aggregate is still being

- Customer link returns
  - Their /23 network is visible again

The /23 is re-injected into AS100's iBGP

- The whole Internet becomes visible immediately
- Customer has Quality of Service perception

## **Aggregation – Example**

- Customer has /23 network assigned from AS100's /19 address block
- AS100 announces customers' individual networks to the Internet

## **Aggregation – Bad Example**

Customer link goes down

Their /23 network becomes unreachable

/23 is withdrawn from AS100's iBGP

 Their ISP doesn't aggregate its /19 network block

/23 network withdrawal announced to peers

starts rippling through the Internet

added load on all Internet backbone routers as network is removed from routing table

#### Customer link returns

Their /23 network is now visible to their ISP

Their /23 network is re-advertised to peers

Starts rippling through Internet

Load on Internet backbone routers as network is reinserted into routing table

Some ISP's suppress the flaps

Internet may take 10-20 min or longer to be visible

Where is the Quality of Service???

## **Aggregation – Summary**

Good example is what everyone should do!

Adds to Internet stability

Reduces size of routing table

**Reduces routing churn** 

Improves Internet QoS for everyone

Bad example is what too many still do!

Why? Lack of knowledge?

Laziness?

# The Internet Today (September 2006)

### Current Internet Routing Table Statistics

BGP Routing Table Entries	196599
Prefixes after maximum aggregation	107356
Unique prefixes in Internet	95338
Prefixes smaller than registry alloc	98092
/24s announced	106069
only 5707 /24s are from 192.0.0.0/8	
ASes in use	22995

## "The New Swamp"

Swamp space is name used for areas of poor aggregation

The original swamp was 192.0.0.0/8 from the former class C block

Name given just after the deployment of CIDR

The new swamp is creeping across all parts of the Internet Not just RIR space, but "legacy" space too

# "The New Swamp" RIR Space – February 1999

# RIR blocks contribute 49393 prefixes or 88% of the Internet Routing Table

Block	Networks	Block	Networks	Block	Networks	Block	Networks
24/8	165	74/8	0	124/8	0	205/8	2584

# "The New Swamp" Summary

RIR space shows creeping deaggregation

It seems that an RIR /8 block averages around 4000 prefixes once fully allocated

So their existing 70 /8s will eventually cause 280000 prefix announcements

Food for thought:

Remaining 59 unallocated /8s and the 73 RIR /8s combined will cause:

528000 prefixes with 4000 prefixes per /8 density

792000 prefixes with 6000 prefixes per /8 density

Plus 12% due to "non RIR space deaggregation"

→ Routing Table size of 887040 prefixes

# "The New Swamp" Summary

- Rest of address space is showing similar deaggregation too ⊗
- What are the reasons?

Main justification is traffic engineering

Real reasons are:

Lack of knowledge

Laziness

**Deliberate & knowing actions** 

# BGP Report (bgp.potaroo.net)

- 179170 total announcements a few months ago
- 116237 prefixes

After aggregating including full AS PATH info

i.e. including each ASN's traffic engineering

35% saving possible

101167 prefixes

After aggregating by Origin AS

i.e. ignoring each ASN's traffic engineering

8% saving possible

### The excuses

- Traffic engineering causes 8% of the Internet Routing table
- Deliberate deaggregation causes 35% of the Internet Routing table

## Efforts to improve aggregation

#### The CIDR Report

Initiated and operated for many years by Tony Bates

Now combined with Geoff Huston's routing analysis

www.cidr-report.org

Results e-mailed on a weekly basis to most operations lists around the world

Lists the top 30 service providers who could do better at aggregating

# Efforts to improve aggregation The CIDR Report

- Also computes the size of the routing table assuming ISPs performed optimal aggregation
- Website allows searches and computations of aggregation to be made on a per AS basis

Flexible and powerful tool to aid ISPs

Intended to show how greater efficiency in terms of BGP table size can be obtained without loss of routing and policy information

Shows what forms of origin AS aggregation could be performed and the potential benefit of such actions to the total table size

Very effectively challenges the traffic engineering excuse

#### **Status Summary**

#### **Table History**

Date	Prefixes	CIDR Aggregated

# Aggregation Potential (source: bgp.potaroo.net/as4637/)

# Aggregation Summary

Aggregation on the Internet could be MUCH better

35% saving on Internet routing table size is quite feasible

Tools are available

Commands on the routers are not hard

**CIDR-Report webpage** 

# **Receiving Prefixes**

### **Receiving Prefixes**

 There are three scenarios for receiving prefixes from other ASNs

**Customer talking BGP** 

**Peer talking BGP** 

**Upstream/Transit talking BGP** 

 Each has different filtering requirements and need to be considered separately

# Receiving Prefixes: From Customers

- ISPs should only accept prefixes which have been assigned or allocated to their downstream customer
- If ISP has assigned address space to its customer, then the customer IS entitled to announce it back to his ISP
- If the ISP has NOT assigned address space to its customer, then:

Check in the four RIR databases to see if this address space really has been assigned to the customer

The tool: whois –h whois.apnic.net x.x.x.0/24

# Receiving Prefixes: From Customers

 Example use of whois to check if customer is entitled to announce address space:

pfs-pc\$ whois -h whois.apnic.net 202.12.29.0

inetnum: 202.12.29.0 - 202.12.29.255

netname: APNIC-AP-AU-BNE

descr: APNIC Pty Ltd - Brisbane Offices + Servers

descr: Level 1, 33 Park Rd

descr: PO Box 2131, Milton

descr: Brisbane, QLD.

country: AU

admin-c: HM20-AP

tech-c: NO4-AP

mnt-by: APNIC-HM

changed: hm-changed@apnic.net 20030108

status: ASSIGNED PORTABLE

source: APNIC

Portable – means its an assignment

to the customer, the customer can

announce it to you

### Receiving Prefixes: From Customers

 Example use of whois to check if customer is entitled to announce address space:

ASSIGNED PA - means that it is

to the ISP who assigned it

**Provider Aggregatable address space** 

and can only be used for connecting

\$ whois -h whois.ripe.net 193.128.2.0

inetnum: 193.128.2.0 - 193.128.2.15

descr: Wood Mackenzie

country: GB

admin-c: DB635-RIPE tech-c: DB635-RIPE status: ASSIGNED PA

mnt-by: AS1849-MNT

changed: davids@uk.uu.net 20020211

source: RIPE

route: 193.128.0.0/14

descr: PIPEX-BLOCK1

origin: AS1849

notify: routing@uk.uu.net

mnt-by: AS1849-MNT

changed: beny@uk.uu.net 20020321

source: RIPE

### Receiving Prefixes: From Peers

 A peer is an ISP with whom you agree to exchange prefixes you originate into the Internet routing table

Prefixes you accept from a peer are only those they have indicated they will announce

Prefixes you announce to your peer are only those you have indicated you will announce

### Receiving Prefixes: From Peers

Agreeing what each will announce to the other:

Exchange of e-mail documentation as part of the peering agreement, and then ongoing updates

OR

Use of the Internet Routing Registry and configuration tools such as the IRRToolSet

www.isc.org/sw/IRRToolSet/

### Receiving Prefixes: From Upstream/Transit Provider

- Upstream/Transit Provider is an ISP who you pay to give you transit to the WHOLE Internet
- Receiving prefixes from them is not desirable unless really necessary

special circumstances – see later

Ask upstream/transit provider to either:

originate a default-route

OR

announce one prefix you can use as default

### Receiving Prefixes: From Upstream/Transit Provider

 If necessary to receive prefixes from any provider, care is required

```
don't accept RFC1918 etc prefixes ftp://ftp.rfc-editor.org/in-notes/rfc3330.txt
```

don't accept your own prefixes

don't accept default (unless you need it)

don't accept prefixes longer than /24

Check Rob Thomas' list of "bogons"

http://www.cymru.com/Documents/bogon-list.html

### **Receiving Prefixes**

 Paying attention to prefixes received from customers, peers and transit providers assists with:

The integrity of the local network

The integrity of the Internet

Responsibility of all ISPs to be good Internet citizens

### Preparing the network

Before we begin...

### **Preparing the Network**

- We will deploy BGP across the network before we try and multihome
- BGP will be used therefore an ASN is required
- If multihoming to different ISPs, public ASN needed:

Either go to upstream ISP who is a registry member, or Apply to the RIR yourself for a one off assignment, or Ask an ISP who is a registry member, or

Join the RIR and get your own IP address allocation too (this option strongly recommended)!

## Preparing the Network Initial Assumptions

- The network is not running any BGP at the moment single statically routed connection to upstream ISP
- The network is not running any IGP at all Static default and routes through the network to do "routing"

### Preparing the Network First Step: IGP

- Decide on IGP: OSPF or ISIS ©
- Assign loopback interfaces and /32 addresses to each router which will run the IGP

Loopback is used for OSPF and BGP router id anchor Used for iBGP and route origination

Deploy IGP (e.g. OSPF)

IGP can be deployed with NO IMPACT on the existing static routing

e.g. OSPF distance might be 110, static distance is 1

**Smallest distance wins** 

# Preparing the Network IGP (cont)

 Be prudent deploying IGP – keep the Link State Database Lean!

Router loopbacks go in IGP

WAN point to point links go in IGP

(In fact, any link where IGP dynamic routing will be run should go into IGP)

Summarise on area/level boundaries (if possible) – i.e. think about your IGP address plan

# Preparing the Network IGP (cont)

Routes which don't go into the IGP include:

Dynamic assignment pools (DSL/Cable/Dial)

**Customer point to point link addressing** 

(using next-hop-self in iBGP ensures that these do NOT need to be in IGP)

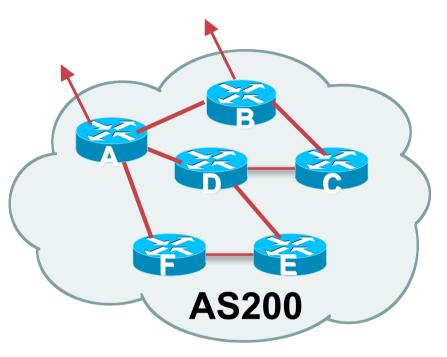

**Static/Hosting LANs** 

**Customer assigned address space** 

Anything else not listed in the previous slide

## Preparing the Network Second Step: iBGP

- Second step is to configure the local network to use iBGP
- iBGP can run on
   all routers, or
   a subset of routers, or
   just on the upstream edge
- iBGP must run on all routers which are in the transit path between external connections

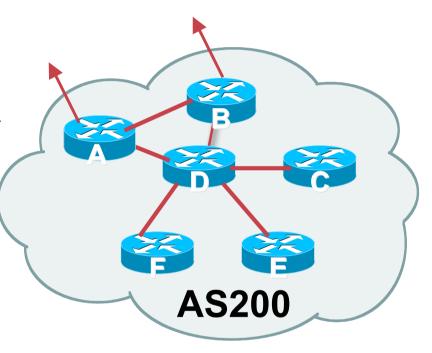

# Preparing the Network Second Step: iBGP (Transit Path)

- iBGP must run on all routers which are in the transit path between external connections
- Routers C, E and F are not in the transit path

Static routes or IGP will suffice

Router D is in the transit path

Will need to be in iBGP mesh, otherwise routing loops will result

# **Preparing the Network Layers**

- Typical SP networks have three layers:
  - Core the backbone, usually the transit path
  - Distribution the middle, PoP aggregation layer
  - Aggregation the edge, the devices connecting customers

# Preparing the Network Aggregation Layer

#### iBGP is optional

Many ISPs run iBGP here, either partial routing (more common) or full routing (less common)

Full routing is not needed unless customers want full table

Partial routing is cheaper/easier, might usually consist of internal prefixes and, optionally, external prefixes to aid external load balancing

Communities and peer-groups make this administratively easy

Many aggregation devices can't run iBGP

Static routes from distribution devices for address pools

IGP for best exit

## Preparing the Network Distribution Layer

Usually runs iBGP

Partial or full routing (as with aggregation layer)

But does not have to run iBGP

IGP is then used to carry customer prefixes (does not scale)
IGP is used to determine nearest exit

 Networks which plan to grow large should deploy iBGP from day one

Migration at a later date is extra work

No extra overhead in deploying iBGP, indeed IGP benefits

## Preparing the Network Core Layer

- Core of network is usually the transit path
- iBGP necessary between core devices

**Full routes or partial routes:** 

Transit ISPs carry full routes in core

**Edge ISPs carry partial routes only** 

Core layer includes AS border routers

#### Decide on:

Best iBGP policy

Will it be full routes everywhere, or partial, or some mix?

iBGP scaling technique

**Community policy?** 

**Route-reflectors?** 

Techniques such as peer groups and peer templates?

### Then deploy iBGP:

Step 1: Introduce iBGP mesh on chosen routers make sure that iBGP distance is greater than IGP distance (it usually is)

Step 2: Install "customer" prefixes into iBGP

**Check!** Does the network still work?

Step 3: Carefully remove the static routing for the prefixes now in IGP and iBGP

**Check! Does the network still work?** 

**Step 4: Deployment of eBGP follows** 

#### Install "customer" prefixes into iBGP?

- Customer assigned address space
   Network statement/static route combination
   Use unique community to identify customer assignments
- Customer facing point-to-point links

Redistribute connected through filters which only permit point-topoint link addresses to enter iBGP

Use a unique community to identify point-to-point link addresses (these are only required for your monitoring system)

Dynamic assignment pools & local LANs

Simple network statement will do this

Use unique community to identify these networks

#### Carefully remove static routes?

Work on one router at a time:

Check that static route for a particular destination is also learned by the iBGP

If so, remove it

If not, establish why and fix the problem

(Remember to look in the RIB, not the FIB!)

- Then the next router, until the whole PoP is done
- Then the next PoP, and so on until the network is now dependent on the IGP and iBGP you have deployed

## Preparing the Network Completion

### Previous steps are NOT flag day steps

Each can be carried out during different maintenance periods, for example:

**Step One on Week One** 

**Step Two on Week Two** 

**Step Three on Week Three** 

And so on

And with proper planning will have NO customer visible impact at all

## Preparing the Network Configuration Summary

- IGP essential networks are in IGP
- Customer networks are now in iBGP iBGP deployed over the backbone
   Full or Partial or Upstream Edge only
- BGP distance is greater than any IGP
- Now ready to deploy eBGP

### **Configuration Tips**

Of templates, passwords, tricks, and more templates

### iBGP and IGPs Reminder!

- Make sure loopback is configured on router iBGP between loopbacks, NOT real interfaces
- Make sure IGP carries loopback /32 address
- Consider the DMZ nets:

Use unnumbered interfaces?

**Use next-hop-self on iBGP neighbours** 

Or carry the DMZ /30s in the iBGP

Basically keep the DMZ nets out of the IGP!

### **Next-hop-self**

Used by many ISPs on edge routers

Preferable to carrying DMZ /30 addresses in the IGP

Reduces size of IGP to just core infrastructure

Alternative to using unnumbered interfaces

Helps scale network

BGP speaker announces external network using local address (loopback) as next-hop

### **Templates**

Good practice to configure templates for everything

Vendor defaults tend not to be optimal or even very useful for ISPs

ISPs create their own defaults by using configuration templates

eBGP and iBGP examples follow

Also see Project Cymru's BGP templates

www.cymru.com/Documents

## **iBGP Template Example**

- iBGP between loopbacks!
- Next-hop-self
   Keep DMZ and external point-to-point out of IGP
- Always send communities in iBGP
   Otherwise accidents will happen
- Hardwire BGP to version 4
   Yes, this is being paranoid!
- Use passwords on iBGP session
   Not being paranoid, VERY necessary

## **eBGP Template Example**

BGP damping

Do NOT use it unless you understand the impact

Do NOT use the vendor defaults without thinking

- Remove private ASes from announcements
   Common omission today
- Use extensive filters, with "backup"

Use as-path filters to backup prefix filters

Keep policy language for implementing policy, rather than basic filtering

Use password agreed between you and peer on eBGP session

### **eBGP Template Example continued**

Use maximum-prefix tracking

Router will warn you if there are sudden increases in BGP table size, bringing down eBGP if desired

Log changes of neighbour state

...and monitor those logs!

Make BGP admin distance higher than that of any IGP

Otherwise prefixes heard from outside your network could override your IGP!!

### **Limiting AS Path Length**

 Some BGP implementations have problems with long AS\_PATHS

**Memory corruption** 

**Memory fragmentation** 

 Even using AS\_PATH prepends, it is not normal to see more than 20 ASes in a typical AS\_PATH in the Internet today

The Internet is around 5 ASes deep on average

Largest AS\_PATH is usually 16-20 ASNs

### **Limiting AS Path Length**

 Some announcements have ridiculous lengths of AS-paths:

This example is an error in one IPv6 implementation

 If your implementation supports it, consider limiting the maximum AS-path length you will accept

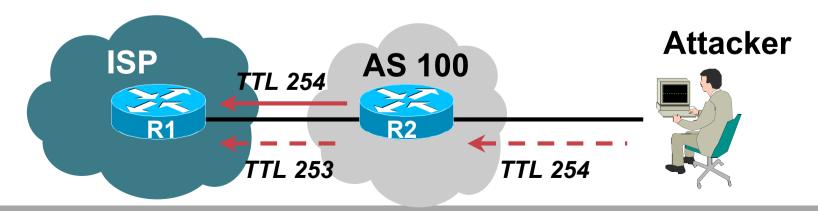

### **BGP TTL "hack"**

Implement RFC3682 on BGP peerings

**Neighbour sets TTL to 255** 

Local router expects TTL of incoming BGP packets to be 254

No one apart from directly attached devices can send BGP packets which arrive with TTL of 254, so any possible attack by a remote miscreant is dropped due to TTL mismatch

### **BGP TTL** "hack"

TTL Hack:

Both neighbours must agree to use the feature TTL check is much easier to perform than MD5 (Called BTSH – BGP TTL Security Hack)

Provides "security" for BGP sessions

In addition to packet filters of course

MD5 should still be used for messages which slip through the TTL hack

See www.nanog.org/mtg-0302/hack.html for more details

### Passwords on BGP sessions

- Yes, I am mentioning passwords again
- Put password on the BGP session

It's a secret shared between you and your peer

If arriving packets don't have the correct MD5 hash, they are ignored

Helps defeat miscreants who wish to attack BGP sessions

 Powerful preventative tool, especially when combined with filters and the TTL "hack"

### Summary

- Use configuration templates
- Standardise the configuration
- Be aware of standard "tricks" to avoid compromise of the BGP session
- Anything to make your life easier, network less prone to errors, network more likely to scale
- It's all about scaling if your network won't scale, then it won't be successful

### **BGP Tutorial**

**End of Part 2** 

**Next: Multihoming**
