

# BGP Tool Hints

Here are some docs about how to build the various BGP tools out there.

## Building BGPDUMP

First off, we clone the git repo locally. Go to the place where you normally do your development work (for example, `/usr/local/src`), and:

```
git clone https://github.com/RIPE-NCC/bgpdump.git
```

Next make sure we have the libraries and packages we need installed:

```
sudo apt install libz-dev libbz2-dev autoheader
```

and then go into the **bgpdump** folder and build the **Makefile**:

```
cd bgpdump  
./bootstrap.sh
```

Once this is done we can then build **bgpdump**:

```
make
```

and then install it:

```
sudo make install
```

which will put **bgpdump** into `/usr/local/bin`.
